BLACK PEN Answer all questions first. **GREEN PEN** Then: tick correct answers; rewrite mistakes.

Assessment Feedback and Reteaching

Name _____ **Class** _____ **Date** _____ **Time** _____ **Teacher** _____

Do Now - Four retrieval questions

1. State what LAN stands for.

2. Using decimal units, how many GB are in 2 TB?
   A) 2 GB
   B) 200 GB
   C) 20,000 GB
   D) 2,000 GB

3. "The letter A must be stored as a miniature bitmap in every text file." Correct this. Explain why.

4. Two computers must read the same text codes. "A character set is a list of fonts." Correct this. Why must the codes agree?

Today's objectives

Use returned assessment feedback to find precise next steps. Improve exam answers by adding missing knowledge or cause-and-effect links.

Key vocabulary - Read, cover, recall

Misconception
An incorrect understanding that can cause repeat errors.

Feedback
Information showing what was correct and how to improve.

Correction
An improved accurate response.

Command word
Instruction such as explain, state or compare.

BLACK PEN: Write one definition in your own words.

Do Now	I Do	We Do	You Do	Review & Improve
Recall previous learning	Read new knowledge	Practise with guidance	Work independently	Check my understanding

BLACK PEN Answer all questions first. **GREEN PEN** Then: tick correct answers; rewrite mistakes.

Learn and practise

New Learning - Key ideas

Read your actual feedback

Record your score and review teacher-identified misconceptions after marking. Do not assume everyone missed the same question.

Identify the error type

Was it a knowledge gap, wrong technical term, missing link between cause/effect, or lost marks for incomplete detail?

Reteach an explanation

Model an accurate answer from one area needing improvement, then try a different example while the steps are shown.

Prove the improvement

Answer new questions independently without copying the model. Compare the new answer with a mark-point checklist only after attempting it.

I Do - Worked model

A pupil wrote: 'A firewall makes the Internet safe.' Improve this into a specific two-mark explanation of how a firewall works. [2 marks]

- The phrase 'makes it safe' is too general to show an exact mechanism.
- A firewall checks traffic against configured rules [1].
- It blocks disallowed or suspicious connections [1], helping restrict unauthorised network access.
- Two linked technical points earn marks; do not claim the firewall stops every attack.

We Do - Guided practice

1. An answer says: 'DNS opens the Internet.' Rewrite it as a two-mark explanation of DNS. [2 marks]

2. An answer says: 'A mesh is better.' Improve it using one advantage and a reason. [2 marks]

3. An answer says: 'Encryption stops hackers.' Write a better two-mark explanation. [2 marks]

BLACK PEN Answer all questions first. **GREEN PEN** Then: tick correct answers; rewrite mistakes.

Think and write

Code First - Predict > Write > Test > Improve

YOUR TASK: Predict the number of outstanding errors.

```
errors = 2
errors = errors - 1
print(errors)
```

You Do - Independent exam questions

Q2. A pupil says a router switches devices on and off. State its real role. [2 marks]

Q3. A colleague claims a two-factor login is unnecessary if a password is long. Explain how two-factor authentication still improves security. [4 marks]

Q4. A student confuses phishing, malware and denial of service. Explain the difference between these threats and one consequence each. [6 marks]

Exit Ticket - True or False?

Useful assessment feedback identifies what to improve and allows a new attempt.

TRUE [ ] **FALSE [ ]**

BLACK PEN Answer all questions first. **GREEN PEN** Then: tick correct answers; rewrite mistakes.

Review & improve

GREEN PEN: Tick each correct point; correct mistakes.

Do Now - Model answers

1. Local Area Network.

2. D - 2,000 GB

3. A character is mapped to a numerical code which is represented in binary.

4. A character set links characters to codes. Use the given code and letter order to find nearby codes; you need not learn the whole ASCII table.

I Do - Explain the model

The phrase 'makes it safe' is too general to show an exact mechanism.

A firewall checks traffic against configured rules [1].

It blocks disallowed or suspicious connections [1], helping restrict unauthorised network access.

Two linked technical points earn marks; do not claim the firewall stops every attack.

We Do - Model answers

1. DNS looks up an IP address associated with a domain name [1], allowing the client to contact the requested server [1].

2. Mesh can provide alternative routes [1], so traffic may still get through when a link fails [1].

3. Encryption scrambles data into ciphertext [1], so an interceptor without the key cannot readily read it [1].

Code First - Answer

```
errors = 2
errors = errors - 1
print(errors)
```

Expected output: 1

You Do - Self-mark

Q2: Forwards data between networks [1] using IP addresses [1].

Q3: Additional independent evidence is required [1], such as a separate authenticator code/device [1]. A stolen password alone is insufficient [1], reducing unauthorised login risk [1].

Q4: Phishing deceives users [1] to reveal private details [1]. Malware is malicious software [1] that may steal or damage files [1]. DoS overwhelms services [1], stopping legitimate users from accessing them [1].

GREEN PEN: Choose the hardest answer. Correct it on lined paper.
