# Do Now · retrieval
## Iteration in C#

Name: _____ Class: _____ Date: _____

Answer four retrieval questions before reviewing earlier learning.

### Q1

What is the difference between = and == in C#?

### Q2

Give one reason Unicode may be chosen instead of standard ASCII.

### Q3

Convert 01011000 0011 to denary using an 8-bit two’s-complement mantissa and a 4-bit two’s-complement exponent.

### Q4

mark=85. The selection is: if mark >= 80 then print("Distinction"); else if mark >= 50 then print("Pass"); else print("Fail"). Determine the output and explain which branch runs.

# New Learning · key ideas

The important knowledge from today's lesson. Read, annotate, and explain it.

## Core idea 1

Iteration repeats instructions — Iteration means executing a block of instructions repeatedly. The loop needs a rule that determines whether another repetition happens.

## Core idea 2

for = count-controlled — CODE:
for (int i = 0; i < 5; i++)
{
Console.WriteLine(i);
} — The header sets the counter, tests whether the loop continues, then changes the counter after each repetition.

## Core idea 3

while = test before repeating — A while loop is useful when you do not know how many attempts will be needed. — CODE:
while (valid == false)
{
// ask again
}

## Annotate the key visual

Explain which labels or features show the main process.

# New Learning · applying the ideas

## Core idea 4

do...while = run first, test after — CODE:
do
{
Console.Write("Password: ");
answer = Console.ReadLine();
}
while (answer != "computer"); — The body executes before the condition is checked, so it always runs at least once.

## Vocabulary · use the correct technical terms

Iteration — Repeating a block of instructions.

Count-controlled iteration — Repetition where the number of repeats is known or controlled by a counter.

Condition-controlled iteration — Repetition that continues according to a Boolean test.

Counter — A variable used to track the number of repetitions.

## Independent skill check · apply the lesson

Write a C# while loop that asks for an age until it is between 0 and 120 inclusive. Test -1, 121 and 0.

More animated examples are available in the original online lesson.

# I Do · worked example

## Problem

Build a times-table program

## Follow the worked method

1. Read the number — CODE:
Console.Write("Number: ");
int number =
int.Parse(Console.ReadLine()); — This happens once before the repetition begins.

2. Calculate each multiple — CODE:
for (int i = 1; i <= 5; i++)
{
int answer = number * i;
Console.WriteLine(answer);
} — The same two instructions run five times, but i changes each time.

3. Trace a known input — CODE:
number = 7

i = 1 → 7
i = 2 → 14
i = 3 → 21
i = 4 → 28
i = 5 → 35

## Why this method works

Identify the decision, rule or invariant that makes the method correct.

# We Do · Try → Discuss → Improve

TRY independently in BLACK PEN; compare methods with a partner; improve your reasoning.

## Guided problem · TRY

Complete the pattern
CODE:

```
for (int i = ?; i <= ?; i++)
{
Console.WriteLine(?);
}
```

## DISCUSS

Compare how you reached the answer. Where could someone make an error?

## IMPROVE

Add one precise correction or a stronger reason. Answers are not printed here.

# You Do · independent practice

Answer these selected original questions in BLACK PEN. Other exam tasks remain online.

## Question 1

Times-table generator

Ask for a whole number and output its first 10 multiples.

Check that you have used the technical terms and explained your decisions.

# You Do · extended practice

Answer these selected original questions in BLACK PEN. Other exam tasks remain online.

## Question 2

Password attempts

Use do...while to keep asking until the password is "computer" .

Count how many attempts were made and output the total after the correct password.

Check that you have used the technical terms and explained your decisions.

# Exit Ticket · reflect and retrieve

## Exit Ticket

A while loop always executes at least once.

## Use key vocabulary from memory

1. Explain Iteration in your own words.

2. Explain Count-controlled iteration in your own words.

3. Explain Condition-controlled iteration in your own words.

## Confidence and next step

How confident are you? Thumbs up / side / down

Which question would you improve after checking the classroom model?

Check answers after the lesson using the teacher-guided source models.
