STAFF REVIEW · H446 116 source models

Separate from the eight-page pupil workbook. This copy is in a public repository and is NOT access controlled. Check technical correctness before use.

Printed question mapping: Booklet Q1 = original online Q1; Booklet Q2 = original online Q2; Booklet Q3 = original online Q3

Do Now — source answers

1. Lexical analysis.

2. In its left subtree (under the chosen no-duplicate convention).

3. Its element locations can be calculated from base address and index.

4. Sum 0 and carry-out 1.

I Do — source worked steps

1. Model answer — Compile source modules into object files; linker resolves the call and produces linked executable (or dynamic references); loader places executable and required libraries in memory and starts execution. — Check: link each claim to the scenario and use precise OCR terminology.

We Do — guided CHECK

1. What must we decide?
Identify the inputs, relevant facts and exact output or judgement required.
Work through the method
Use the middle stage of the visual to follow the process and state each intermediate result.
Shared worked answer
Lexical and syntax stages succeeded. The linker cannot find the referenced symbol's definition: implementation may be missing, not linked, misspelled or incompatible. Add the correct object/library or fix the symbol.

You Do — source mark schemes

1. Linker resolves external references/builds runnable image [3]; loader places executable/dependencies in memory and initiates process [3].

2. Static includes library code in binary [2], dynamic references shared library at runtime [2], size/updates/dependency trade-off [2].

3. Compile per module [2]; link/reference external dependency [2]; runtime loader requires compatible library [2]; mitigation packaging/version control [2].

Exit Ticket — source answer

1. False. Dependencies may be missing/incompatible when loaded.
