STAFF REVIEW · H446 234 source models

Separate from the eight-page pupil workbook. This copy is in a public repository and is NOT access controlled. Check technical correctness before use.

Printed question mapping: Booklet Q1 = original online Q1; Booklet Q2 = original online Q2; Booklet Q3 = original online Q3

Do Now — source answers

1. For example pair programming, TDD or continuous integration.

2. It lets the team adjust the next iteration using feedback.

3. An early model used to explore and test an idea.

4. It can reveal technical feasibility issues before expensive implementation.

I Do — source worked steps

1. Predict first — Spiral is appropriate because major technical and safety risks need assessment at each cycle.

2. Model and explain — It demands experienced risk assessment and carries greater time/management overhead than simpler methods.

We Do — guided CHECK

1. Predict first
RAD suits evolving interface requirements because the café can see and comment on working prototypes.
Model and explain
A risk is that repeated quick changes may weaken maintainability without time for robust design.

You Do — source mark schemes

1. [4] Spiral is risk-driven [1], but adds assessment/management cost [1]; RAD creates prototypes with user feedback [1], but rapid changes can compromise design quality [1].

2. [6] Spiral explicitly assesses critical risks [1] and validates feasibility each cycle [1]; RAD rapidly gathers interface feedback [1], which is less central than safety risks [1]; choose Spiral [1] because controlling safety/technical uncertainty matters more than fast UI prototyping [1].

3. [6] Early working prototypes [1]; frequent direct feedback [1]; requirements clarified quickly [1]; helps prioritise useful features [1]; users must be available [1] and rushed design/testing can undermine quality [1].

Exit Ticket — source answer

1. False. Spiral is explicitly risk-driven; RAD centres on rapid prototyping and frequent user feedback.
