STAFF REVIEW · H446 296 source models

Separate from the eight-page pupil workbook. This copy is in a public repository and is NOT access controlled. Check technical correctness before use.

Do Now — source answers

1. Computer-driven decisions based on programmed or modelled rules.

2. Only necessary data are processed.

3. A system incorrectly flags something as positive/risky.

4. Popped 7; final stack [3,2].

I Do — source worked steps

1. Point — Pupils could benefit from earlier safeguarding support. — Why this develops the argument — Name who benefits and the specific benefit; “AI is useful” would be too vague.

2. Explain — The system could flag concerning activity sooner than staff manually reviewing the same activity. — Why this develops the argument — Give a plausible mechanism. “Could” recognises that this benefit needs evidence rather than being guaranteed.

3. Consequence — If trained staff check those alerts promptly, they could offer help before a concern becomes more serious. — Why this develops the argument — Develop the impact on pupils and state the condition on which the benefit depends.

4. Challenge — However, legitimate research could trigger false alerts, distressing pupils and diverting staff from genuine concerns. — Why this develops the argument — Challenge the benefit with a specific competing consequence, rather than adding an unrelated disadvantage.

5. Judgement — On balance, I would support a limited, reviewed trial only if staff can check alerts promptly, collection is restricted and pupils can challenge mistakes; otherwise, I would delay introduction. — Why this develops the argument — Weigh benefit against risk and make the decision conditional. Human review helps but does not guarantee fairness.

6. The complete model — Pupils could benefit from earlier safeguarding support. The system could flag concerning activity sooner than staff manually reviewing the same activity. If trained staff check those alerts promptly, they could offer help before a concern becomes more serious. However, legitimate research could trigger false alerts, distressing pupils and diverting staff from genuine concerns. On balance, I would support a limited, reviewed trial only if staff can check alerts promptly, collection is restricted and pupils can challenge mistakes; otherwise, I would delay introduction. — Point → explanation → consequence → counterargument → justified judgement. Use these as prompts, not a compulsory paragraph formula.

We Do — guided CHECK

1. Choose a relevant point
A. Keeping every history could intrude on pupils’ privacy.
B. Keeping every history must make pupils feel safer.
Stronger choice: A
Keeping every browsing history could intrude on pupils’ privacy.
Why?

A identifies a plausible risk. B assumes that all pupils will feel safer without evidence.
Choose an explanation
A. Privacy matters because privacy is important to pupils.
B. A full history could reveal sensitive interests beyond a concern.
Stronger choice: B
Full histories could reveal sensitive interests beyond a particular safeguarding concern.
B explains what creates the risk. A repeats the point without explaining it.
Choose a consequence
A. Pupils may avoid legitimate research if they fear misinterpretation.
B. Pupils will certainly stop using every school device.
Pupils might avoid legitimate research if they fear that staff will misinterpret it.
A gives a plausible behavioural consequence. B makes an unsupported prediction about every pupil.
Choose a fair counterargument
A. Long retention is acceptable because more data is always better.
B. A retained history could help staff investigate a later concern.
However, a retained history could help staff understand a concern reported later.
B recognises a relevant benefit without claiming it justifies unlimited collection. A assumes more data must be better.
Choose a justified judgement
A. Reject the two-year full-history plan unless its need is shown; assess a narrower option.
B. Reject every monitoring tool because privacy always outweighs safeguarding.
I would reject the full-history plan as proposed: the possible investigative benefit does not yet justify keeping everything for two years. Assess a narrower, justified collection and retention approach instead.
A weighs the proposal's benefit against its specific privacy cost. B makes an absolute claim without weighing this scenario.
Our model argument
Keeping a full browsing history could intrude on pupils' privacy because it may reveal sensitive interests beyond a particular concern. Pupils might avoid legitimate research if they fear misinterpretation. However, retained histories could help staff investigate concerns reported later. I would reject this plan as proposed: that possible benefit does not yet justify keeping everything for two years. The school should assess a narrower approach and justify its collection, access and retention.
A different judgement needs to explain why the benefit outweighs the privacy cost under stated conditions.

You Do — source mark schemes

1. Pupils could receive earlier safeguarding support. The system could identify concerning activity sooner than a manual review of the same activity. If trained staff check promptly and accurately, pupils could receive help before a concern escalates.
Check: name a stakeholder; explain a mechanism; add a consequence. Do not repeat "it helps pupils" three ways.

2. Automatic detention could reduce the time staff spend deciding initial sanctions. However, legitimate research could trigger a false alert, so a pupil may be punished unfairly and lose trust before an appeal is heard. I would reject automatic detention on an alert alone: review before action matters more than this time saving. A later appeal does not undo all of the initial harm.

Check: explain both effects, weigh their importance and judge this change. Other supported conclusions are possible; an alert alone is not proof.

3. Automated shortlisting could help recruiters process applications faster, leaving time for interviews. However, past hiring decisions may contain bias, and career breaks do not establish a lack of skill. Rejecting these applicants without review could exclude capable people unfairly. I would not approve this design: the speed benefit does not justify an unexplained exclusion. Assess job-relevant evidence, audit outcomes and offer meaningful human review before relying on it. Check: transfer the reasoning to recruitment; develop effects on both groups; justify a decision. “AI is biased” alone does not explain the mechanism or consequence.

Exit Ticket — source answer

1. False. It names competing points but does not explain their consequences or why one should carry more weight. A judgement needs reasons tied to this proposal.
