Name: _____ Class: _____ Date: _____

Answer four retrieval questions before reviewing earlier learning.

Q1

What prints after int x=2; x=x*3;?

Q2

What does a queue remove first?

Q3

Why should loops have a stopping condition?

Q4

What is 0 XOR 1?

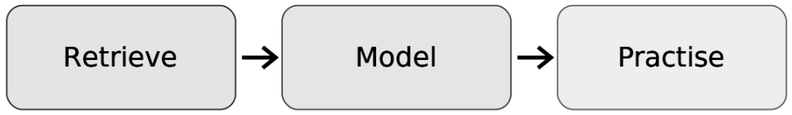

New Learning · key ideas

The important knowledge from today's lesson. Read, annotate, and explain it.

Core idea 1

Explain the important decision — Initialise the accumulator once. Each iteration changes total; i++ then advances the counter. Test i <= 3 before every pass.

Key visual · complete concept

Annotate the key visual

Explain which labels or features show the main process.

You Do · extended practice

Answer these selected original questions in BLACK PEN. Other exam tasks remain online.

Question 3

Apply independently
Write a C# loop to output 1, 2, 3. [3]

Check that you have used the technical terms and explained your decisions.

You Do · independent practice

Answer these selected original questions in BLACK PEN. Other exam tasks remain online.

Question 1

Apply independently

Trace the final total for 2 + 4 + 6 using an accumulator. [3]

Question 2

Apply independently

Give a reason to choose a while loop rather than for. [2]

Check that you have used the technical terms and explained your decisions.

New Learning · applying the ideas

Vocabulary · use the correct technical terms

iteration — Repetition of statements

accumulator — Running total

counter — Tracks repetitions

condition — Controls loop continuation

Check your understanding

Explain one key process in your own words using two of the terms above.

I Do · worked example

Problem

Trace an accumulator

Follow the worked method

1. Initialise and trace pass one — Initially total=0 and i=1. The test 1<=3 is true; total becomes 1, then i becomes 2.

2. Trace the remaining passes — At i=2, total becomes 1+2=3; i becomes 3. At i=3, total becomes 3+3=6; i becomes 4.

3. Show the failed test — 4<=3 is false, so the body stops and total remains 6. A while loop may run zero times; a do...while tests after its body and runs at least once.

Why this method works

Identify the decision, rule or invariant that makes the method correct.

We Do · Try → Discuss → Improve

TRY independently in BLACK PEN; compare methods with a partner; improve your reasoning.

Guided problem · TRY

Discuss, then respond
for i = 0 to 3 exclusive, how many iterations?

DISCUSS

Compare how you reached the answer. Where could someone make an error?

IMPROVE

Add one precise correction or a stronger reason. Answers are not printed here.
