I Do · Read new knowledge

Key vocabulary

bit width — Number of bits in a representation.

two's complement — Fixed-width signed binary format.

mantissa — Signed fractional significant component.

exponent — Power-of-two scaling value.

precision — Number of significant digits retained.

New learning

Respect the bit width — Write positive 5 using exactly eight bits.

Invert then add one — The result is 11111011_2, representing −5 in 8-bit two's complement.

Interpret floating-point differently — 0.1100_2 is fractional 0.75; multiplying by 2^3 gives 6.

Worked example

Convert −10 to 8-bit two's complement.

1. Predict — Write 00001010 for +10 and invert to 11110101.

2. Explain — Add one: 11110110 represents −10.

We Do · Practise with guidance

Convert −7 to 8-bit two's complement.

```
+7=00000111
NOT=?
+1=?
```

Predict

Start with +7 = 00000111 and invert all bits.

Explain

Add one to 11111000, giving 11111001 for −7.

Question 1

Convert unsigned binary 00001011 to decimal.

Question 2

Encode −12 in 8-bit two's complement.

Question 3

Normalise positive $0.0011_2 \times 2^5$ using a two's-complement fractional mantissa.

Exit Ticket · Answer before checking

Eight-bit two's complement can represent decimal +128.
