LESSON 296 · Build an argument about AI monitoring

Name: _____ Class: _____ Date: _____

Time: _____ Teacher: _____

Work through the pages in order. Answer in BLACK PEN first. Check in GREEN PEN only after the Exit Ticket.

Do Now · Recall previous learning

Q1. What is automated decision-making?

Q2. Why is data minimisation useful?

Q3. What is a false positive?

Q4. Stack push 3, push 7, pop, push 2. Give bottom-to-top stack and popped value.

BLACK PEN Answer all questions first. GREEN PEN Then: tick correct answers; rewrite mistakes.

I Do · Read new knowledge

Key vocabulary

stakeholder — A person or group affected by a decision.

false positive — An alert that incorrectly treats harmless activity as concerning.

bias — Systematic distortion that can produce unfair outcomes.

counterargument — A reason that challenges or limits an argument.

justified judgement — A decision supported by reasons that weigh the alternatives.

New learning

Knowledge before judgement — An alert is an estimate, not proof. False positives flag harmless activity; false negatives miss genuine concerns. Overall accuracy can hide different error rates for different groups.

Privacy and fairness — Monitoring can reveal sensitive activity. Limit collection and access to what the purpose requires. Biased training data or poor context can make particular groups more likely to be flagged unfairly.

People and work — Automating the first scan could save staff time. Checking alerts, training and appeals also require time and skills. Work may shift towards review rather than simply disappear.

Develop the reasoning — Name a stakeholder, explain the mechanism, then show a consequence. “It saves time” is a point; “staff can review a concern sooner, so a pupil may receive earlier support” develops it.

Weigh and decide — Ask what weakens the benefit: false alerts, staff capacity or intrusive collection. Judge which matters most here and give conditions. Legal compliance alone does not settle the ethical question.

Worked example

Should the school introduce the proposed AI monitoring?

1. Point — Pupils could benefit from earlier safeguarding support. — Why this develops the argument — Name who benefits and the specific benefit; “AI is useful” would be too vague.

2. Explain — The system could flag concerning activity sooner than staff manually reviewing the same activity. — Why this develops the argument — Give a plausible mechanism. “Could” recognises that this benefit needs evidence rather than being guaranteed.

BLACK PEN Answer all questions first. GREEN PEN Then: tick correct answers; rewrite mistakes.

False. It names competing points but does not explain their consequences or why one should carry more weight. A judgement needs reasons tied to this proposal.

Try the question again

Choose one question you got wrong. All correct? Choose the hardest.

Page 1 onwards · Do Now

Q1. Computer-driven decisions based on programmed or modelled rules.

Q2. Only necessary data are processed.

Q3. A system incorrectly flags something as positive/risky.

Q4. Popped 7; final stack [3,2].

You Do pages · Independent questions

Q1. Pupils could receive earlier safeguarding support. The system could identify concerning activity sooner than a manual review of the same activity. If trained staff check promptly and accurately, pupils could receive help before a concern escalates.
Check: name a stakeholder; explain a mechanism; add a consequence. Do not repeat “it helps pupils” three ways.

Q2. Automatic detention could reduce the time staff spend deciding initial sanctions. However, legitimate research could trigger a false alert, so a pupil may be punished unfairly and lose trust before an appeal is heard. I would reject automatic detention on an alert alone: review before action matters more than this time saving. A later appeal does not undo all of the initial harm.
Check: explain both effects, weigh their importance and judge this change. Other supported conclusions are possible; an alert alone is not proof.

Q3. Automated shortlisting could help recruiters process applications faster, leaving time for interviews. However, past hiring decisions may contain bias, and career breaks do not establish a lack of skill. Rejecting these applicants without review could exclude capable people unfairly. I would not approve this design: the speed benefit does not justify an unexplained exclusion. Assess job-relevant evidence, audit outcomes and offer meaningful human review before relying on it.
Check: transfer the reasoning to recruitment; develop effects on both groups; justify a decision. “AI is biased” alone does not explain the mechanism or consequence.

Exit Ticket · Model answer

BLACK PEN Answer all questions first. GREEN PEN Then: tick correct answers; rewrite mistakes.

3. Consequence — If trained staff check those alerts promptly, they could offer help before a concern becomes more serious. — Why this develops the argument — Develop the impact on pupils and state the condition on which the benefit depends.

4. Challenge — However, legitimate research could trigger false alerts, distressing pupils and diverting staff from genuine concerns. — Why this develops the argument — Challenge the benefit with a specific competing consequence, rather than adding an unrelated disadvantage.

5. Judgement — On balance, I would support a limited, reviewed trial only if staff can check alerts promptly, collection is restricted and pupils can challenge mistakes; otherwise, I would delay introduction. — Why this develops the argument — Weigh benefit against risk and make the decision conditional. Human review helps but does not guarantee fairness.

6. The complete model — Pupils could benefit from earlier safeguarding support. The system could flag concerning activity sooner than staff manually reviewing the same activity. If trained staff check those alerts promptly, they could offer help before a concern becomes more serious. However, legitimate research could trigger false alerts, distressing pupils and diverting staff from genuine concerns. On balance, I would support a limited, reviewed trial only if staff can check alerts promptly, collection is restricted and pupils can challenge mistakes; otherwise, I would delay introduction. — Point → explanation → consequence → counterargument → justified judgement. Use these as prompts, not a compulsory paragraph formula.

We Do · Practise with guidance

Should the school keep every browsing history?

The school now wants to keep a full browsing history for every pupil for two years. Safeguarding staff could search it later. The school has not shown that keeping everything is necessary. Staff would still review alerts before acting.

Choose A or B on mini-whiteboards. Explain why the other sentence is weaker before revealing the response.

Choose a relevant point

A. Keeping every history could intrude on pupils’ privacy.

B. Keeping every history must make pupils feel safer.

Stronger choice: A

Keeping every browsing history could intrude on pupils’ privacy.

Why?

A identifies a plausible risk. B assumes that all pupils will feel safer without evidence.

Choose an explanation

A. Privacy matters because privacy is important to pupils.

B. A full history could reveal sensitive interests beyond a concern.

Stronger choice: B

Full histories could reveal sensitive interests beyond a particular safeguarding concern.

B explains what creates the risk. A repeats the point without explaining it.

Choose a consequence

A. Pupils may avoid legitimate research if they fear misinterpretation.

You Do · Work independently

BLACK PEN: Write your own answers. Do not look at the Review & Improve pages yet.

Question 1

Return to the original proposal: trained staff check alerts and there are no automatic sanctions. Write three sentences developing one benefit for pupils. Use: point → why → consequence.

Question 2

Changed proposal: an alert now triggers an automatic detention; a pupil can appeal afterwards. Evaluate this change in a short paragraph. Develop a benefit, challenge it and reach a justified judgement.

Question 3

An employer proposes AI shortlisting trained on past hiring decisions. It would reject applicants with career breaks without review. Evaluate the proposal in a short paragraph, considering applicants and recruitment staff. Use your own structure.

Exit Ticket · Answer before checking

“The system is fast. However, it could invade privacy. Therefore, use it.” is already a well-justified argument.
