Exit Ticket · reflect and retrieve

Exit Ticket

Setting required on an HTML form is enough to secure a server from invalid data.

Use key vocabulary from memory

1. Explain element in your own words.

2. Explain attribute in your own words.

3. Explain form in your own words.

Confidence and next step

How confident are you? Thumbs up / side / down

Which question would you improve after checking the classroom model?

Check answers after the lesson using the teacher-guided source models.

RHS COMPUTING / OCR H446 / LESSON 291 DRAFT · TEACHER REVIEW

Do Now · retrieval

HTML structures and forms

Name: _____ Class: _____ Date: _____

Answer four retrieval questions before reviewing earlier learning.

Q1

What does an HTML element supply to the browser?

Q2

Which part of a browser page contains displayed content?

Q3

What does HTTPS protect?

Q4

C# array int[] a={3,5,7}; append 9 conceptually using a new array and give sum.

New Learning · key ideas

The important knowledge from today's lesson. Read, annotate, and explain it.

Core idea 1

Understand — HTML uses nested elements to give structure and semantics: head contains metadata and body contains visible content.

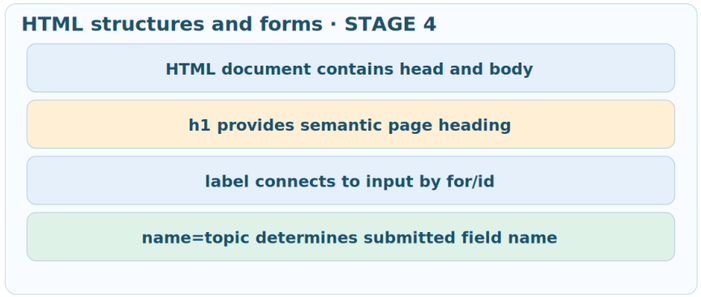

Core idea 2

Trace — Forms collect and submit inputs. The label's for value matches input's id; the input's name is the key submitted to the server.

Core idea 3

Evaluate — With method GET, query parameters appear in the URL; don't use GET for confidential credentials. Client-side required validation improves usability but is not a substitute for server validation.

Key visual · complete concept

Annotate the key visual

Explain which labels or features show the main process.

You Do · extended practice

Answer these selected original questions in BLACK PEN. Other exam tasks remain online.

Question 3

Explain two shortcomings of relying entirely on required and type='email' for security-sensitive form validation. [6]

Check that you have used the technical terms and explained your decisions.

You Do · independent practice

Answer these selected original questions in BLACK PEN. Other exam tasks remain online.

Question 1

State roles of html, head, body, form, input and label. [6]

Question 2

Write a form that submits an age field by GET to /check and explain sent key. [6]

Check that you have used the technical terms and explained your decisions.

New Learning · applying the ideas

Vocabulary · use the correct technical terms

element — HTML start/end tags and content.

attribute — Property on HTML element.

form — Collects and submits user data.

label — Identifies a form control.

Check your understanding

Explain one key process in your own words using two of the terms above.

More animated examples are available in the original online lesson.

I Do · worked example

Problem

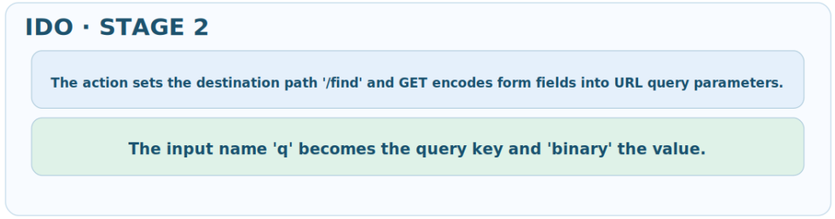

What is sent by a GET form whose input name is q and value is binary?

Follow the worked method

1. Predict first — The action sets the destination path '/find' and GET encodes form fields into URL query parameters.

2. Show method — The input name 'q' becomes the query key and 'binary' the value.

Source model · final illustrated step

Why this method works

Identify the decision, rule or invariant that makes the method correct.

We Do · Try → Discuss → Improve

TRY independently in BLACK PEN; compare methods with a partner; improve your reasoning.

Guided problem · TRY

Predict first
The label for and input id must match exactly.

DISCUSS

Compare how you reached the answer. Where could someone make an error?

IMPROVE

Add one precise correction or a stronger reason. Answers are not printed here.
