STAFF REVIEW · H446 246 source models

Separate from the eight-page pupil workbook. This copy is in a public repository and is NOT access controlled. Check technical correctness before use.

Printed question mapping: Booklet Q1 = original online Q1; Booklet Q2 = original online Q2; Booklet Q3 = original online Q3

Do Now — source answers

1. It prioritises identifying and addressing risks in each cycle.

2. Selecting relevant detail and omitting irrelevant detail.

3. A condition that ends recursion.

4. Final [4,4,12,8]. Sum=28. Indexes 0 and 2 changed; 1 and 3 unchanged.

I Do — source worked steps

1. Predict the method — Replace vague 'best' with a measurable objective such as minimum total travel time.

2. Check and explain — Specify route constraints and verify a produced route covers all required locations.

We Do — guided CHECK

1. Predict the method
Use explicit demand and stock data and define what fairness means with measurable priorities.
Check and explain
Check total allocated never exceeds stock and each class allocation follows the stated policy.
Original worked example:
Inputs: stock, demand per class, priorities
Output: allocations respecting stock
Criterion: minimise unmet essential demand

You Do — source mark schemes

1. [4] Input available bays/vehicle requests [1]; constraint one vehicle per bay [1]; output bay assignments [1]; test no duplicate assignments [1].

2. [6] 'Nicest' is subjective [1]; need measurable criteria [1], such as age-suitable genre [1] and prior loan count [1]; rank by agreed score [1]; output ordered ISBN list [1].

3. [6] Decomposition splits the overall task into subproblems [1]; divide-and-conquer recursively splits input [1], sorts sublists [1] and merges them [1]; combined result is sorted [1], recurrence gives O(n log n) work for merge sort [1].

Exit Ticket — source answer

1. False. It must first be expressed with measurable inputs, rules and success criteria.
